Turbine Flow Meters
with Female Inch Threads

Application

Turbine flow meters serve to accurate measurement of continuous and discontinuous flow rate values. This turbine flow meter is most suited for liquids with low viscosity, such as for example water, solvents, cleaning agents and light oils. The large range of different pipe connections and structural sizes allows using these flow meters in various applications and in various industrial sectors.

Principle and Design

The turbine flow meters KEM are indirect volume counters built on the principle of using the counter with the Woltmann turbine impeller. The energy coming from the flow of the liquid sets in motion a centrifally and rotatably mounted rotor. The number of the rotor revolutions is directly proportional to the volumetric liquid flow. The speed of rotation of the turbine rotor is contactlessly sensed through the wall of the flow meter body. The impulses generated by each turbine blade correspond to a certain accurate volumetric flow of the measured medium.

The number of pulses for a certain period of time corresponds to the value of the medium flow rate expressed, for example, in litres per minute. The lightweight turbine wheel allows quick response to changes in the value of the medium flow rate (< 50 m/s). The flow meters with wing rotor are less sensitive to dirt compared to common turbine flow meters.

Applications

- Tap and demineralised water
- Fuels
- Liquefied gases
- Pharmaceutical liquids
- Fuel oil
- Solvents
- Hydraulic oil

Features

- Short response time (> 50 ms)
- Dynamic measuring system
- High resolution
- Temperature: -196°C to +350°C
- Pressure: up to 630 bar
- Robust carbide bearings
